## COMPLETE LISTING OF THE CLAIMS

The following lists all of the claims that are or were in the above-identified patent application. The status identifiers respectively provided in parentheses following the claim numbers indicate the current statuses of the claims.

- 1. (Canceled)
- 2. (Canceled)
- 3. (Canceled)
- 4. (Currently Amended) The A method of claim 1 for allocating contributions toward a cooperative effort, the method comprising:

constructing a state vector representing a plurality of pairs of entangled qubits, wherein the plurality of pairs of entangled qubits consists of N pairs;

selecting 2N operators to be respectively applied to the 2N qubits, wherein selecting the 2N operators includes each of a plurality of players selecting one or more of the 2N operators for a set of the qubits assigned to the player, wherein the plurality of players consists of n players, N is equal to a product of n(n-1) and a probability p, and the probability p is less than 1, and the operators are selected by each player according to a choice of the player regarding the cooperative effort;

applying each of the 2N operators only to a portion of the state vector that represents the qubit corresponding to the operator;

evaluating a final state vector that results from the application of the 2N operators to thereby assign respective results to the players; and

the players contributing according to the results respectively assigned, the results designating whether respective players will cooperate in or defect from the cooperative effort.

- 5. (Original) The method of claim 4, wherein the probability p is equal to log(n)/n.
- 6. (Currently Amended) The method of elaim 1 claim 4, wherein software executed in a classical computer performs the step of applying the operators to the state vector.
  - 7. (Currently Amended) The method of claim 1 claim 4, wherein constructing the

    -2
    Serial No. 10/734,713

PATENT LAW OFFICE OF DAVID MILLERS 1221 SUN RIDGE ROAD PLACERVILLE, CA 95667 PH: (530) 621-4545 FX: (530) 621-4543 state vector comprises setting a system in a quantum state corresponding to the state vector.

- 8. (Original) The method of claim 7, wherein the system comprises 2N photons.
- 9. (Original) The method of claim 8, wherein the system is selected from a group consisting of SQUIDs, NMR systems, individual atoms, individual molecules, individual ions, cavity quantum electro-dynamic (QED) systems; and photonic systems having quantum states implementing the qubits.
  - 10. (Previously Presented) A system comprising:
  - a source of multiple channels of entangled photon pairs;
- a plurality of stations, where each station is associated with a plurality of the channels and is capable of performing a player-selected operation on states of photons associated with the station;
- a first optical network that for each channel and each entangled photon pair in the channel, delivers a first photon from the entangled photon pair to a first of the stations associated with the channel and delivers a second photon from the entangled photon pair to a second of the stations associated with the channel; and
- a measurement system coupled to measure the states of the photons after delivery to the stations.
- 11. (Original) The system of claim 10, wherein in each of the entangled photon pairs, a first polarization state of the first photon depends on a second polarization state of the second photon.
- 12. (Original) The system of claim 11, the player-selected operations of the stations change polarizations states of the photons.
  - 13. (Original) The system of claim 12, wherein each station comprises: a polarizing beam splitter;
- a first polarization changing element in a path of a first polarization component exiting the polarizing beam splitter; and
- a second polarization changing element in a path of a second polarization component exiting the polarizing beam splitter.

PATENT LAW OFFICE OF DAVID MILLERS 1221 SUN RIDGE ROAD PLACERVILLE, CA 95667 PH: (530) 621-4545 FX: (530) 621-4543

- 14. (Original) The system of claim 10, wherein each system consists of linear optics.
- 15. (Original) The system of claim 10, wherein each of the stations is associated with two of the channels.
- 16. (Original) The system of claim 10, wherein the plurality of stations comprises n stations, wherein each station is associated with n-1 of the channels.
  - 17. (Original) The system of claim 10, wherein:

the stations comprise n stations; and

the channels comprise  $p \cdot n(n-1)$  channels for a probability p less than 1.

- 18. (Original) The system of claim 17, wherein the probability p is equal to log(n)/n.
- 19. (Original) The system of claim 10, wherein the source of multiple channels of qubits comprises one or more correlated semiconductor light sources.
- 20. (Original) The system of claim 10, wherein the source of multiple channels of qubits comprises:
  - a laser; and
- a parametric down-converter capable of converting a photon from the laser into a pair of photons in an entangled state.
- 21. (Original) The system of claim 10, wherein the source of multiple channels of qubits comprises:
  - a source of unentangled photons; and
  - a system that creates entanglements between photons in different channels.
- 22. (Original) The system of claim 10, wherein the measurement system comprises an optical system implementing a joint operation on the entangled photon pairs.
  - 23. (Original) The system of claim 22, wherein the optical system unentangles the

PATENT LAW OFFICE OF DAVID MILLERS 1221 SUN RIDGE ROAD PLACERVILLE, CA 95667 PH: (530) 621-4545 entangled photon pairs.

- 24. (Original) The system of claim 22, wherein the optical system comprises a controlled NOT gate.
- 25. (Previously Presented) The system of claim 10, wherein the plurality of stations comprises at least three stations.
- 26. (Currently Amended) The method of elaim 1 claim 4, wherein n is at least three.
